Aluminium condensation boilers

ALU PLUS HE

USER, INSTALLATION AND SERVICING INSTRUCTIONS

ENSURE THAT THESE INSTRUCTIONS ARE LEFT FOR THE USER AFTER COMPLETION OF THE BENCHMARK SECTION

PLEASE READ THE IMPORTANT NOTICE WITHIN THIS GUIDE REGARDING YOUR BOILER WARRANTY

BOILER DETAILS

please position here a sticker from installation pack

TRANSLATION OF THE ORIGINAL INSTRUCTIONS
SAFE HANDLING

This boiler may require 2 or more operatives to move it into its installation site, remove it from its packaging and during movement into its installation location. Manoeuvring the boiler may include the use of a sack truck and involve lifting pushing and pulling.

Caution should be exercised during these operations.

Operatives should be knowledgeable in handling techniques when performing these tasks and the following precautions should be considered:

- Grip the boiler at the base
- Be physically capable
- Use personal protective equipment as appropriate e.g. gloves, safety footwear.

During all manoeuvres and handling actions, every attempt should be made to ensure the following unless unavoidable and/or the weight is light.

- Keep back straight
- Avoid twisting at the waist
- Always grip with the palm of the hand
- Keep load as close to the body as possible
- Always use assistance

WARNING

Caution should be exercised when performing any work on this appliance.

Protective gloves and safety glasses are recommended.

- Avoid direct contact with sharp edges.
- Avoid contact with any hot surfaces.

NOTICE

Please be aware that due to the wet testing of the appliance, there may some residual water in the hydraulic circuit.

- Protect any surfaces, carpets or floorings.
- Use a suitable container to catch any water that escape when removing the protective caps from the connections.
Code Of Practice
For the installation, commissioning and servicing of domestic heating and hot water products

Benchmark places responsibilities on both manufacturers and installers.* The purpose is to ensure that customers** are provided with the correct equipment for their needs, that it is installed, commissioned and serviced in accordance with the manufacturer’s instructions by competent persons and that it meets the requirements of the appropriate Building Regulations. Installers are required to carry out work in accordance with the following:

Standards of Work
- Be competent and qualified to undertake the work required.
- Install, commission, service and use products in accordance with the manufacturer’s instructions provided.
- Ensure that where there is responsibility for design work, the installation is correctly sized and fit for purpose.
- Meet the requirements of the appropriate Building Regulations. Where this involves notifiable work be a member of a Competent Persons Scheme or confirm that the customer has notified Local Authority Building Control (LABC), prior to work commencing.
- Complete all relevant sections of the Benchmark Checklist/Service Record when carrying out commissioning or servicing of a product or system.
- Ensure that the product or system is left in a safe condition and, whenever possible, in good working order.
- Highlight to the customer any remedial or improvement work identified during the course of commissioning or servicing work.
- Refer to the manufacturer’s helpline where assistance is needed.
- Report product faults and concerns to the manufacturer in a timely manner.

Customer Service
- Show the customer any identity card that is relevant to the work being carried out prior to commencement or on request.
- Give a full and clear explanation/demonstration of the product or system and its operation to the customer.
- Hand over the manufacturer’s instructions, including the Benchmark Checklist, to the customer on completion of an installation.
- Obtain the customer’s signature, on the Benchmark Checklist, to confirm satisfactory demonstration and receipt of manufacturer’s instructions.
- Advise the customer that regular product servicing is needed, in line with manufacturers’ recommendations, to ensure that safety and efficiency is maintained.
- Respond promptly to calls from a customer following completion of work, providing advice and assistance by phone and, if necessary, visiting the customer.
- Rectify any installation problems at no cost to the customer during the installer’s guarantee period.

*The use of the word “installer” is not limited to installation itself and covers those carrying out installation, commissioning and/or servicing of heating and hot water products, or the use of supporting products (such as water treatment or test equipment).
**Customer includes householders, landlords and tenants.

© Heating and Hotwater Industry Council (HHIC)
The Benchmark Scheme

Sime is a licensed member of the Benchmark Scheme which aims to improve the standards of installation and commissioning of domestic heating and hot water systems in the UK and to encourage regular servicing to optimise safety, efficiency and performance.

Benchmark is managed and promoted by the Heating and Hotwater Industry Council.

For more information visit www.centralheating.co.uk.

Please ensure that the installer has fully completed the Benchmark Checklist in the use and maintenance section of the installation instructions supplied with the product and that you have signed it to say that you have received a full and clear explanation of its operation.

The installer is legally required to complete a commissioning checklist as a means of complying with the appropriate Building Regulations (England and Wales).

All installations must be notified to Local Area Building Control either directly or through a Competent Persons Scheme.

A Building Regulations Compliance Certificate will then be issued to the customer who should, on receipt, write the Notification Number on the Benchmark Checklist.

This product should be serviced regularly to optimise its safety, efficiency and performance.

The service engineer should complete the relevant Service Record on the Benchmark Checklist after each service.

The Benchmark Checklist may be required in the event of any warranty work and as supporting documentation relating to home improvements in the optional documents section of the Home Information Pack.

Important Information

IT IS A STATUTORY REQUIREMENT THAT ALL GAS APPLIANCES ARE INSTALLED BY COMPETENT PERSONS, IN ACCORDANCE WITH THE GAS SAFETY (INSTALLATION AND USE) REGULATIONS (CURRENT EDITION). The manufacturer’s instructions must not be taken as overriding any statutory requirements, and failure to comply with these regulations may lead to prosecution.

No modifications to the appliance should be made unless they are fully approved by the manufacturer.

GAS LEAKS: DO NOT OPERATE ANY ELECTRICAL SWITCH, OR USE A NAKED FLAME. TURN OFF THE GAS SUPPLY AND VENTILATE THE AREA BY OPENING DOORS AND WINDOWS CONTACT THE GAS EMERGENCY SERVICE ON 0800111999.

---

Please refer to commissioning instructions for filling in the checklist at the back of this installation guide.

Note: All Gas Safe registered installers carry a ID Card.

You can check your installer is Gas Safe Registered by calling 0800 408 5577

---

**SIME COMBINATION BOILERS**

**Installer checklist**

Please remember to carry out the following checks after installation. This will achieve complete customer satisfaction, and avoid unnecessary service calls. A charge will be made for a service visit where the fault is not due to a manufacturing defect.

- Has a correct by-pass been fitted and adjusted?
- Has the system and boiler been flushed?
- Is the system and boiler full of water, and the correct pressure showing on the pressure gauge?
- Is the Auto Air Vent open?
- **Has the pump been rotated manually?**
- Is the gas supply working pressure correct?
- Is the boiler wired correctly? [See installation manual].
- **Has the D.H.W. flow rate been set to the customer requirements?**
- Has the customer been fully advised on the correct use of the boiler, system and controls?
- Has the Benchmark Checklist in the use and maintenance section of this manual, been completed?
WARNINGS

– After having unpacked the boiler ensure that it is undamaged and complete including the valve pack, hanging bracket and template.

– The appliance must be used as intended. Sime declines all responsibility for any injury or damage to persons, animals, or property as a result of improper installation, adjustment, maintenance or use.

– In the event of water leaks, disconnect the appliance from the mains power supply, close the water mains and seek help from a qualified engineer.

– Periodically check that the operating pressure of the water heating system when cold be included in the range 0.8–6.0 bar. If this is not the case, increase the pressure or contact professionally qualified personnel.

– If the appliance is not used for a long period of time, the following operations must be carried out:
  -set the main isolation switch to “OFF”;
  -close the gas and water valves for the water heating system.

– In order to ensure optimal appliance operations Sime recommends that maintenance and checks are carried out at least ONCE A YEAR or according to the specific legal provisions.

WARNINGS

– It is recommended that all operators read this manual carefully in order to use the appliance in a safe and rational manner.

– This manual is an integral part of the appliance. It must therefore be kept for future reference and must always accompany the appliance in the event of the appliance being transferred to another Owner or System Manager or being installed on another system.

– Installation and maintenance of this appliance must be carried out by a qualified company or by a professionally qualified technician in accordance with the instructions contained in the manual. Once the work is complete, the company or technician will issue a declaration of conformity with national and local technical standards and legislation in force in the country where the appliance will be used.
RESTRICTIONS

⚠️ DO NOT

- To allow children under the age of 8 to use the appliance. The appliance can be used by children no younger than 8 years old, by people with physical or cognitive disabilities, and by people lacking experience or the necessary knowledge, provided that they are supervised or have been instructed on how to use the appliance safely and that they understand the risks associated with it.

- To allow children to play with the appliance.

- To allow unsupervised children to perform user maintenance and cleaning.

- Do not use electrical devices or appliances such as switches, electrical appliances etc if you can smell gas. If this should happen:
  - open the doors and windows to ventilate the room;
  - turn the gas off at the meter;
  - call the emergency service 0800 111999.

- Do not touch the appliance with bare feet or with any wet part of the body.

- Do not carry out any repair, maintenance or cleaning operation before having disconnected the appliance from the mains power by setting the main switch to “OFF”, and closing the gas supply.

- Do not modify the safety or adjustment devices without authorization and instructions from the manufacturer.

⚠️ DO NOT

- Do not block the condensate drain.

- Do not pull, detach or twist the electrical cables coming out of the appliance even if the appliance is disconnected from the mains power supply.

- Do not expose the boiler to atmospheric agents. These boilers can also be installed in partially covered areas, as per EN 15502, with a maximum ambient temperature of 60 °C and a minimum ambient temperature of 0 °C. It is generally advisable to install the boilers below weathered roofs, on the balcony or in a protected niche, to protect them from exposure to weathering agents (rain, hail and snow). All boilers provide a standard antifreeze function.

- Do not block or reduce the size of the ventilation openings of the room where the appliance is installed, if present.

- Remove the mains power and gas supply from the appliance if the external temperature could fall below ZERO (risk of freezing).

- Do not leave containers with flammable substances in the room where the appliance is installed.

- Do not dispose of the packaging material irresponsibly as it could be dangerous. Packaging must be disposed of as specified by the legislation in force in the country where the appliance will be used.
COMPLIANCE
Our company declares that ALU PLUS HE boilers comply with the following directives:
- Gas Appliances EU Regulation 2016/426
- Low Voltage Directive 2014/35/UUE
- Electromagnetic Compatibility Directive 2014/30/EU
- Ecodesign Directive 2009/125/EC
- Boiler Efficiency Directive 92/42/EEC

SYMBOLS

WARNING
To indicate actions which, if not carried out correctly, can result in injury of a general nature or may damage or cause the appliance to malfunction; these actions therefore require particular caution and adequate preparation.

ELECTRICAL HAZARD
To indicate actions which, if not carried out correctly, could lead to injury of an electrical nature; these actions therefore require particular caution and adequate preparation.

DO NOT
To indicate actions which MUST NOT BE carried out.

CAUTION
To indicate particularly important and useful information.
VERY IMPORTANT!

PLEASE MAKE SURE YOUR COMMISSIONING CHECKLIST AND THE SERVICE INTERVAL RECORDS ENCLOSED ARE FILLED IN CORRECTLY.

ALL GAS SAFE REGISTERED INSTALLERS CARRY A GAS SAFE ID CARD.

BOTH SHOULD BE RECORDED IN YOUR COMMISSIONING CHECKLIST AND A SERVICE INTERVAL RECORDS.

YOU CAN CHECK YOUR INSTALLER IS GAS SAFE REGISTERED

BY CALLING ON 0800 408 5500 OR ALTERNATIVELY WWW.GASSAFEREGISTER.CO.UK
1 USING THE BOILER ALU PLUS HE

1.1 Control panel
The control panel allows all operators to make all adjustments necessary to manage Sime ALU PLUS HE boilers and connected systems.

2 DESCRIPTION OF COMMANDS

ON/OFF BUTTON.
ON = Boiler has electric power.
OFF = Boiler has electric power but is not available for operation. The protection functions are on, however.

SUMMER MODE BUTTON. By pressing this button the boiler operates only on demand for domestic hot water (function not available).

WINTER MODE BUTTON. By pressing this button the boiler operates for heating and domestic hot water.

SET DHW BUTTON. By pressing this button the temperature of the domestic hot water is displayed (function not available).

SET HEATING BUTTON. With the first press of this button the temperature of heating circuit 1 is displayed. With the second press of this button the temperature of heating circuit 2 is displayed. With the third press of this button the temperature of heating circuit 3 is displayed.

RESET BUTTON. Lets you reset operation after an operating error.

INCREASE BUTTON. By pressing this button the value set is increased.

REDUCE BUTTON. By pressing this button the value set is reduced.

3 BUTTONS RESERVED FOR INSTALLER (access to INST parameters and CASCADE parameters)

CONNECTION THROUGH PC. To be used only with the Sime programming kit and only by authorised personnel. Do not connect other electronic devices (cameras, phones, MP3s etc.). Use a tool to remove the cap and replace it after use.

WARNING: Communication port sensitive to static electricity. Before use, it is advisable to touch an earthed metal surface to get rid of static electricity.

INFORMATION BUTTON. Press the button several times to scroll through the parameters.

CHIMNEY SWEEP FUNCTION BUTTON. Press the button several times to scroll through the parameters.

REDUCE BUTTON. For changing the default values set.

INCREASE BUTTON. For changing the default values set.

4 LIGHT BAR
Blue = Operation.
Red = Operating error.

5 TIMER (optional)
Mechanical timer (code 8092228) or digital timer (code 8092229) for programming heating/dhw.
1.2 Start-up

1.2.1 Preliminary checks

**WARNING**
Should it be necessary to access the areas in the bottom part of the appliance, make sure that the system components and pipes are not hot (risk of burning).

Commissioning of the **ALU PLUS HE** boiler must be carried out by professionally qualified personnel after which the boiler can operate automatically. It may, however, be necessary for the system manager to start the appliance autonomously after having turned it off, without involving a technician: for example, after a holiday. In such cases it must first be checked that the fuel and water system isolation valves are open.

1.2.2 Ignition

After having carried out the preliminary checks, proceed as follows:
- set the main system switch to “ON”
- the blue bar (4) comes on and the screen saved by the electronic circuit board before the appliance was turned off is shown on the display.

**Example:** winter; delivery temperature (40°C); system pressure [1.3 bar].

When heat is requested from the systems the boiler automatically carries out:
- the operational checks
- ignition and starts automatic operation.

**CAUTION**
- When the display is not backlit (off), the first press on each function button serves to backlight it (turn it on).
- To manually stop the boiler press button [6].
- The display will show the following screen.

1.3 Adjusting the delivery temperature

The control panel on **ALU PLUS HE** boilers lets you manually adjust the delivery temperature on two temperature levels by choosing the best ones for the systems managed (e.g. 80°C and 50°C).

To adjust the delivery temperature on the first of the two levels:
- press button [6] (twice if the display isn’t backlit). The symbol [1] will be shown on the display
- press buttons [4] or [5] until the desired value is displayed (e.g. 80°C)

![Fig. 2](image)

- press buttons [4] or [5] until the desired value is displayed (e.g. 50°C)

Once the settings are completed, to go back to the starting screen press button [6] or wait for approx. 60 seconds without touching any buttons.

1.4 Malfunctions

In the event of a fault/malfunction the message “ALL” will appear on the display with the alarm number and the light bar (4) will turn red.

**Example:** “ALL 02” (Low System Pressure Error: less than 0.8 bar).

**NOTE:** in the case of “ALL 02”, the system can be reintegrated, when cold, without disconnecting the power supply to be able to see when the pressure reaches the correct value (be included in the range 0.8-6.0 bar). The warning disappears when normal conditions are reset and the boiler starts up again automatically.
In the case of all other errors, before repairing the fault, it is recommended, as a precautionary measure, that you:
- disconnect the appliance from the mains power by setting the main switch to “OFF”
- close the fuel isolation valve.

**NOTE:** When, in addition to the message "ALL ..." the symbol also appears on the display, after having repaired the fault, button must be pressed for approx. 3 seconds, and then released. The boiler starts up again normally.

### 1.5 Fault / malfunction codes

If a fault/malfunction is detected during boiler operation, the message "ALL" will appear on the display followed by the fault code and the light bar (4) will go red.

Possible errors are reported below.

### 1.6 SIME remote control connection (optional accessory)

The boiler is ready for connection to a SIME remote control. When the remote control is connected or, alternatively, when a remote supervision device is connected, the boiler display shows:

For set-up and use of the remote control, follow the instructions supplied with the device.

**CAUTION**

A Sime remote control and a remote supervision device cannot be connected at the same time.
2 MAINTENANCE

2.1 Servicing
For the appliance to operate correctly and efficiently it is recom-
mended that the system manager calls upon the services of a Professionally Qualified Technician to carry out ANNUAL maintenance.

CAUTION
Maintenance must ONLY be carried out by qualified professionals who follow the indications provided in the INSTALLATION AND MAINTENANCE INSTRUC-
TIONS.

2.2 External cleaning

WARNING
– Should it be necessary to access the areas in the bottom part of the appliance, make sure that the system components and pipes are not hot [risk of burning].
– Before performing any maintenance, put on protective gloves.

2.2.1 Cleaning the case
When cleaning the cladding, use a cloth dampened with soap and water or alcohol for stubborn marks.

DO NOT
Do not use abrasive products.

3 DISPOSAL

3.1 Disposal of the equipment (European Directive 2012/19/EU)
Boilers and electrical and electronic appliances used professionally or classified as professional waste must not be disposed of as unsorted municipal waste at the end of their life. Instead, they must be disposed of as per Directive 2012/19/EU and Italian Legislative Decree 49/2014. Please speak with your local retailer regarding returning or replacing your appliance, should your product be replaced by another identical product. Your product has been designed and manufactured in such a way as to reduce its impact on the environment and human health as much as possible. However, it contains components which may be hazardous if not disposed of correctly. Your role as the product purchaser handling the appliance at the end of its life is very important when it comes to reducing the impact of waste on the environment and human health, and promoting recycling. The crossed-out wheeled bin symbol found on your appliance, and shown here, means that at the end of your product’s lifecycle, it must not be disposed of with unsorted municipal waste. Instead, it must be disposed of, in accordance with the law, as electrical and electronic waste. Individual countries may also define specific rules on how to handle electrical and electronic waste. Before disposing of your appliance, please check the rules in force in your country.

DO NOT
Dispose of the product with urban waste.

4 DESCRIPTION OF THE APPLIANCE

4.1 Characteristics

Sime ALU PLUS HE aluminium boilers generate heat through condensation and are designed to heat rooms and produce domestic hot water, if the system contains a storage tank. They are composed of:

- an aluminium body, with low water content and high exchange surface, to maximise energy efficiency and heat yields
- a total pre-mix microflame burner in stainless steel that allows high modulation ratios, combustion stability and low emissions of pollutants (Class NOx \( \times 6 \)), to be achieved
- a variable speed fan required for modulation and air/gas mixing
- a combustion circuit which MUST be "type B" (open) with respect to the place where the boiler is installed, depending on the configuration of the combustion air inlet adopted during installation
- a control panel which, if equipped with an external sensor, allows the delivery temperature to be adjusted according to the outdoor temperature (sliding temperature operation). The boiler therefore provides only the heat the User actually needs, avoiding energy being wasted and the associated costs. If there are malfunctions or faults, the specific error codes are displayed, which simplifies the work of Technical Service.

During planning solutions have been adopted to:

- constantly achieve the best air/gas mixture
- reduce heat dispersion
- reduce noise.

Sime ALU PLUS HE boilers can be installed as single units or in a cascade composed of between two and eight appliances with the same heating output.

When boilers are connected in a cascade, they communicate with the master boiler, treating the cascade as a single heat generator where:

\[ \text{Cascade output} = \text{Boiler output} \times \text{no. of boilers installed} \]

Sime ALU PLUS HE boilers can be connected to 0-10 V DC controls, to an auxiliary sensor and to the Sime Home or Sime Home Plus remote controls. They can manage direct systems or direct systems and two mixed systems (or two groups of mixed systems connected in parallel), if the optional kits "mix 1 kit-code 8092275" and "mix 2 kit-code 8092276" are installed. A solar system can also be installed using the "solar kit-code 8092277" and the "MODBUS interface code 8092278" to communicate via MODBUS with remote devices. All kits are optional accessories to be ordered separately. After each stoppage, whether automatic or manual, post-ventilation and post-circulation are performed. The system should include an INAIL safety device 8101596 (for 360 ALU PLUS HE) or 8101597 (for 720-1100 ALU PLUS HE), which are mandatory for ITALY ONLY, and a plate heat exchanger or hydraulic separator, depending on the system characteristics.

Sime ALU PLUS HE boilers also have the following functions:

- anti-freeze function, which is activated automatically if the temperature of the water inside the boiler falls below the value set under "PAR 35" and if the outdoor temperature falls below the value set under "PAR 36"
- antiblocking function for the pump and any diverter valve, which is activated automatically every 24 hours if there have been no requests for heat
- the chimney sweep function lasts 15 minutes and makes the job of the qualified technician easier when measuring the parameters and combustion efficiency
- anti-legionella function when a storage tank is used
- automatic adjustment of the ignition output and minimum and maximum heating output. The outputs are managed automatically by the electronic circuit board to ensure maximum system usage flexibility
- dispersal function, so that if the delivery probe detects a temperature of 90°C, the fan runs until it falls to 89°C
- screed drying function, to keep the floor at a pre-set temperature profile with the help of the mixer valve
- "External sensor value correction" function.

4.1.1 Operation

When the general switch is activated the boiler is powered with electricity. The blue bar (4) on the control panel lights up. The symbols, "- -" message and the system pressure are shown correctly on the screen. To turn the boiler on or off press button ( ), then button ( ) to select "WINTER mode" or button ( ) to select "SUMMER mode". The value of the delivery sensor detected at that moment appears on the display.

CAUTION

When the display is not backlit (off), the first press on each function button serves to backlight it (turn it on); the second press to carry out the command.

When heat is requested from the systems or the storage tank, if there is one, the control panel automatically carries out the functional checks, and electrically powers the gas valve and ignition transformer to turn on the flame. This is how automatic operation of the boiler begins. When the request for heat is fulfilled the flame goes out, but the fan and the circulation pump remain in operation to carry out post-ventilation and post-circulation at the end of which they stop and wait for the next request for heat.
### 4.1.2 Domestic Hot Water (DHW)

Domestic hot water can be produced if the system has a dhw circuit with a storage tank. The dhw system can be created either upstream or downstream of the water shut-off valve. The installation company is responsible for choosing and paying for all the systems’ components and devices.

**CAUTION**

The installation company is responsible for choosing and paying for all the systems’ components and devices.

### 4.2 Check and safety devices

The **ALU PLUS HE** boilers are equipped with the following check and safety devices:
- thermal safety thermostat 98°C with automatic reset
- system water pressure transducer
- delivery sensor (SM)
- return sensor (SR)
- exhaust sensor (SF)
- air pressure switch
- siphon pressure switch.

**DO NOT**

Do notcommission or operate the appliance with safety devices which do not work or which have been tampered with.

**WARNING**

Safety device may only be replaced by professional qualified personnel using **Sime** original spare parts.

---

### 4.3 Identification

The **ALU PLUS HE** boilers can be identified by means of:

1. **Packaging label**: this is located on the outside of the packaging and provides a code, the serial number of the boiler and the bar code
2. **Technical Data Plate**: this is located inside the front panel of the boiler and provides the technical data, appliance performance information and any other information required by law in the country where the appliance will be used.
4.3.1 Technical Data Plate

4.8 Minimum water flow rate

To protect the heat exchanger from overheating, a sufficient water flow rate must be maintained.

By observing the water flow rates shown in the table below, a maximum ΔT of 35°C is guaranteed at the minimum heat input, and a maximum ΔT of 25°C at maximum heat input.

The table below shows the minimum water flow rate required for each boiler.

4.9 Load losses

The graph shows the curves for the load losses of the boilers, necessary for the correct circulation pump to be chosen.

WARNING
- Not respecting the recommended water flow rates could cause the appliance to malfunction.
- At first start-up it is useful to check the rotation of the pumps’ shafts.
- DO NOT operate the pumps without any water.
- The pumps chosen must have a consumption suitable for the fuse installed on the electrical panel (4AT).
4.10 Control panel
The control panel allows all operators to make all adjustments necessary to manage Sime ALU PLUS HE boilers and connected systems.

1 DISPLAY ICONS DESCRIPTION

- **SUMMER MODE ICON.**
- **WINTER MODE ICON.**
- **DHW MODE ICON.**
- **HEATING MODE ICON.**
- **GRADUATED OUTPUT SCALE.** The segments of the bar light up in proportion to the output delivered by the boiler.
- **BURNER OPERATION AND BLOCKING ICON.**
- **RESET REQUIRED ICON.**
- **CHIMNEY SWEEP FUNCTION ICON.**
- **SECONDARY DIGITS.** The boiler displays the system's pressure value.
- **MAIN DIGITS.** The boiler displays the values set, fault status and outdoor temperature.

2 DESCRIPTION OF COMMANDS

**ON/OFF BUTTON.**
- ON = Boiler has electric power.
- OFF = Boiler has electric power but is not available for operation. The protection functions are on, however.

**SUMMER MODE BUTTON.** By pressing this button the boiler operates only on demand for domestic hot water (function not available).

**WINTER MODE BUTTON.** By pressing this button the boiler operates for heating and domestic hot water.

**SET DHW BUTTON.** By pressing this button the temperature of the domestic hot water is displayed (function not available).

**SET HEATING BUTTON.** With the first press of this button the temperature of heating circuit 1 is displayed. With the second press of this button the temperature of heating circuit 2 is displayed. With the third press of this button the temperature of heating circuit 3 is displayed.

**RESET BUTTON.** Lets you reset operation after an operating error.

**INCREASE BUTTON.** By pressing this button the value set is increased.

**REDUCE BUTTON.** By pressing this button the value set is reduced.

3 BUTTONS RESERVED FOR INSTALLER (access to INST parameters and CASCADE parameters)

**CONNECTION THROUGH PC.** To be used only with the Sime programming kit and only by authorised personnel. Do not connect other electronic devices (cameras, phones, MP3s etc.). Use a tool to remove the cap and replace it after use.

**WARNING:** Communication port sensitive to static electricity. Before use, it is advisable to touch an earthed metal surface to get rid of static electricity.

**INFORMATION BUTTON.** Press the button several times to scroll through the parameters.

**CHIMNEY SWEEP FUNCTION BUTTON.** Press the button several times to scroll through the parameters.

**REDUCE BUTTON.** For changing the default values set.

**INCREASE BUTTON.** For changing the default values set.

4 LIGHT BAR

- Blue = Operation.
- Red = Operating error.

5 TIMER (optional)
Mechanical timer (code 8092228) or digital timer (code 8092229) for programming heating/dhw.
4.11  Wiring diagram

Fig. 10

(*) The PM pump (modulating) can be installed instead of the Pcp pump
(**) JP1 engaged = TZ2 usable; 0 ... 10V DC not usable; JP1 disengaged = TZ2 not usable; 0 ... 10V DC usable
Fig. 11
4.11.1 RS 485 board

The RS485 board is provided as standard and is factory installed on every boiler. It is positioned in the cover of the control panel and fixed in place with two screws. It is needed for communication between boilers, when they are installed in a cascade (see the specific diagrams under "Electrical connections for the cascade").

**Connection for communication with other boilers in the cascade**

---

**CAUTION**
Installer must:
- Connect the boiler to a 230v -50Hz single phase power supply through a fused mains switch, with at least 3mm spacing between contacts, fused at 3amps which ensures complete cut-off in overvoltage category III conditions (i.e. where there is at least 3 mm between the open contacts).
- Respect the connections L (Live) - N (Neutral).
- Ensure that the special power cable is only replaced with a cable ordered as a spare part and connected by professionally qualified personnel.

---

**CAUTION**
Installer must:
- Connect the earth wire to an effective earthing system. **Sime** declines all responsible for any injury or damage to persons, animals, or property as a result of failure to provide adequate earthing of the appliance.

---

**DO NOT**

Do not use water pipes for earthing the appliance.
The Benchmark Scheme

Benchmark places responsibilities on both manufacturers and installers. The purpose is to ensure that customers are provided with the correct equipment for their needs, that it is installed, commissioned and serviced in accordance with the manufacturer’s instructions by competent persons and that it meets the requirements of the appropriate Building Regulations.

The Benchmark Checklist can be used to demonstrate compliance with Building Regulations and should be provided to the customer for future reference.

Installers are required to carry out installation, commissioning and servicing work in accordance with the Benchmark Code of Practice which is available from the Heating and Hotwater Industry Council who manage and promote the Scheme.
INSTALLATION AND SERVICING INSTRUCTIONS

Installer Checklist

Please remember to carry out the following checks after installation. This will achieve complete customer satisfaction, and avoid unnecessary service calls. A charge will be made for a service visit where the fault is not due to a manufacturing defect.

Has a correct by-pass been fitted and adjusted?
Has the system and boiler been flushed?
Is the system and boiler full of water, and the correct pressure showing on the pressure gauge?
Is the Auto Air Vent open?
Has the pump been rotated manually?
Is the gas supply working pressure correct?
Is the boiler wired correctly? (See installation manual).

Has the D.H.W. flow rate been set to the customer requirements?
Has the customer been fully advised on the correct use of the boiler, system and controls?
Has the Benchmark Checklist in the use and maintenance section of this manual, been completed?

5 INSTALLATION

CAUTION
The appliance must only be installed by the Sime Technical Service or by qualified professionals who MUST wear suitable protective safety equipment.

5.1 Receiving the product
Appliances Sime ALU PLUS HE are supplied in a single package, protected by a nylon cover, placed on wooden pallets.

The plastic bag found inside the packaging contains the following:
- Installation, use and maintenance manual
- Certificate of warranty
- Hydrostatic test certificate
- Control unit manual

DO NOT
Do not leave packaging material around or near children since it could be dangerous. Dispose of it as prescribed by legislation in force.

5.3 Handling
Once the packaging is removed, moving the appliance is as follows:
- remove the front panel (1) to make it easier to grip and move
- insert two 1” tubes (2) into the relevant housings or slot the forks of the fork-lift (3) under the structure
- lift the appliance and move it with suitable equipment.

WARNING
Use suitable tools and personal protection when removing the packaging and when handling the appliance. Observe the maximum weight that can be lifted per person.
5.4 Ventilation requirements
The location where the appliance is to be installed must comply with the Technical Regulations and Legislation in force. It must be equipped with suitably sized air vents for "TYPE B" installations.

APPROXIMATE MINIMUM DISTANCES

![Diagram of ventilation requirements](image)

WARNINGS
- Before assembling the appliance, the installer MUST make sure that the floor can support the weight.
- Observe the required clearances.
- The installation room must have an appropriate height for the installed power, according to the local and national legislation in force.
- When the installation is in a cascade, the minimum space between the boilers is 1 m.

DO NOT
- To install ALU PLUS HE appliances outside if not suitably protected from the weather.

5.5 New installation or installation of a replacement appliance
The boiler must be installed in a fixed location and only by specialized and qualified person in compliance with all instructions contained in this manual. The installation of this boiler must be in accordance with the relevant requirements of the current Gas Safety (installation and use), the local building regulations and I.E.E. wiring regulations. Detailed recommendations for air supply and fluing are given in BS5440. The following notes are for general guidance: it is not necessary to have a purpose provided air vent in the room or compartment in which the appliance is installed.

CAUTION
It is a condition of the warranty that the boiler is installed in accordance with the instructions in this manual. The boiler must be registered with Gas Safe Register, the Benchmark record must be completed and the boiler is serviced annually and recorded in this manual.

CAUTION
If the domestic water supply is metered or should a water meter be added at a later time, a small expansion vessel should be included in the domestic water pipework.

5.6 Cleaning the system
Before connecting the boiler it is recommended that the system be flushed in accordance to BS 7593, to eliminate any foreign bodies that may be detrimental to the operating efficiency of the appliance.

CAUTION
Failure to flush and add inhibitor to the system may invalidate the warranty.

5.7 Characteristics of feedwater and system treatment
- All recirculatory systems will be subject to corrosion unless an appropriate water treatment is applied. This means that the efficiency of the system will deteriorate as corrosion sludge accumulates within the system, risking damage to pump and valves, boiler noise and circulation problems.
- Before connecting the boiler the associated central heating system must be flushed in accordance with the guidelines given in BS 7593 "Treatment of water in domestic hot water central heating systems".
- Sime recommends only the use of FERNOX products for the flushing and final treatment of the system water. This is particularly important in hard water areas. Failure to flush and add inhibitor to the system may invalidate the appliance warranty. Artificially softened water must not be used to fill the heating system. Naturally soft water areas can corrode aluminium heat exchangers. Adding Fernox F1 or Mb-1 will guard against corrosion.
- Sime promote the fitting of TF1 System filter with any new boiler installation.
- It is important to check the inhibitor concentration after installation, system modification and annually on a service visit in accordance with the manufacturer’s instructions. Test kits are available from inhibitor stockists; the return of the Fernox test report should be kept with the Benchmark to validate warranty.
- Where Central heating systems are susceptible to freezing a mixture of inhibitor and anti-freeze should be added in accordance with the DWTA code of practice and the Manufacturer instructions.
- The addition of sealing agents to system water is not recommended because deposits can be left in heat exchanger causing circulation issues.
5.8 Plumbing connections

The dimensions of the water fittings of Sime ALU PLUS HE boilers are given below.

</tbody>
</table>

**CAUTION**
- The condensate outlet duct must be airtight, suitably sized to that of the siphon and must not be restricted at any point.
- The condensate outlet must be constructed in full compliance of the National or Local regulations in force.

**CAUTION**
- It is recommended that a condensate neutralising unit be provided and the pipework should have a downward angle of at least 3%.
- Before commissioning the appliance, fill the siphon with water.

5.9 Condensate outlet/collection

**CAUTION**
- The condensate outlet duct must be airtight, suitably sized to that of the siphon and must not be restricted at any point.
- The condensate outlet must be constructed in full compliance of the National or Local regulations in force.

5.10 Gas supply

The gas connection must be made using seamless steel or copper tube. Where the piping has to pass through walls, a suitable insulating sleeve must be provided.

When sizing gas piping, from the meter to the boiler, take into account both the volume flow rates (consumption) in m³/h and the relative density of the gas in question.

The sections of the piping making up the system must be such as to guarantee a supply of gas sufficient to cover the maximum output available from the boiler, limiting pressure loss between the gas meter and any apparatus being used to not greater than 1.0 mbar for family II gases (natural gas).

An adhesive data badge is sited inside the front panel; it contains all the technical data identifying the boiler and the type of gas for which the boiler is arranged.

**CAUTION**
- It is recommended that the gas line has a suitable filter.
5.11 Smoke outlet and combustion air inlet

Sime ALU PLUS HE boilers are “Type B” (B23P).

The smoke outlet and combustion air inlet systems that can be created for single boilers are shown below. Information regarding cascading boiler systems is provided in the relevant section of this manual.

![Diagram of smoke outlet and combustion air inlet systems](image)

(*“Combustion air filter kit” included (optional).

**WARNINGs**

- When the Sime ALU PLUS HE boiler takes in combustion air from the place of installation it MUST BE EQUIPPED with air vents created as described by the regulations in force in the destination country.
- Sime ALU PLUS HE boilers use a smoke detector, located upstream from the smoke duct, which safely stops the boilers if the temperature of the smoke becomes too high.
- We recommend using a smoke duct made from aluminium, plastic or stainless steel, provided that it complies with the regulations in form. The material should be suitably resistant to high temperatures and condensation. The condensation liquid from the flue pipe must be drained before it enters the aluminium boiler body so as to avoid corrosion or blockages.
- Outlet ducts which are not isolated are a potential source of danger.
- The flue pipe must be provided with a condensate outlet and must ensure the minimum drop in pressure set by current regulations, considering pressure to be “zero” at the connection with the duct.
- It is recommended that a condensate neutraliser be installed before discharging it into the waste water drain.
- The flue pipe must be of the correct size for condensation thermal units. Flue pipes and smoke ducts that are inadequate or of the wrong size can cause problems with the combustion parameters and generate noise.
- Ensure that the duct and condensate outlet pipes have an angle of at least 3% towards the neutraliser or the drain.
- Install a suitable filter on the combustion air inlet duct to prevent dust or dirt from being aspirated.

**DO NOT**

- Do not block or reduce the size of the air vents of the place of installation or the appliance.

5.11.1 Maximum duct lengths

The table shows the maximum permitted lengths for the smoke outlet and combustion air inlet ducts, expressed in metres.

<table>
<thead>
<tr>

5.12 Electrical connections and External controls

Sime ALU PLUS HE boilers require the connections given below which must be carried out by the installer or by professionally qualified personnel. Some of the cabling is to the MC terminal board and some to the electronic circuit board connectors.

To connect the electrics:
- remove the top panel (1) and front panel (2) to access the MC terminal board
- undo the screws [3] that attach the control panel and rotate it forward
- undo the screws on the back of the control panel and take off the cover (4) to access the electronic board.

The cables must go into the back of the boiler and must be locked when the job is completed with the tear-proof cable clip that’s already fitted. Once the connections have been made, reassemble what was previously dismantled.

Connections to be made by the installer

The connections shown below MUST be made for single boilers or for the master boiler in a cascade.

ALU PLUS HE 360

KEY:
MCP Primary circuit pump (4A - 230V)
L Live
N Neutral
PB Tank pump (4A - 230V)
PM Modulating pump (4A - 230V)
VD Diverter valve
PWM-GND Modulation for modulating pump (if present)
SF-SF1 Flue gas damper consent (Max 4A - 230V)
PC-PC1 Connections for pump operating signal
SRF Flue gas damper

ALU PLUS HE 720 - ALU PLUS HE 1100

KEY:
MCP Primary circuit pump (6A - 230V)
L Live
N Neutral
PB Tank pump (6A - 230V)
PM Modulating pump (6A - 230V)
VD Diverter valve
PWM-GND Modulation for modulating pump (if present)
SF-SF1 Flue gas damper consent (Max 4A - 230V)
PC-PC1 Connections for pump operating signal
SRF Flue gas damper

Fig. 21

Fig. 22

Fig. 23
Connections to electronic circuit board
The connections shown below MUST be made for single boilers or for the master boiler in a cascade.

**KEY:**
- **L** Live
- **N** Neutral
- **SE** External sensor
- **CR** Remote control or, alternatively, a MODBUS interface kit
- **SB/SA** Storage tank sensor or auxiliary sensor (e.g. system delivery sensor, SM)
- **TZ1÷TZ2** Room thermostat for the zone
- **JP1** Dial jumper or 0...10V DC or TA2 (***)
- **AUX** Auxiliary connection
- **VZ** Zone valve
- **TA1 (230V)** Room Thermostat
- **AR** Remote alarm

(***)JP1 engaged = TA2 usable; 0 ... 10V DC not usable; JP1 disengaged = TA2 not usable; 0 ... 10V DC usable

**WARNINGS**
It is compulsory:
- to use an omnipolar cut-off switch, disconnect switch, in compliance with EN standards (contact opening of at least 3 mm)
- to respect connection L (Live) - N (Neutral)
- to refer to the electrical diagrams in this manual for any electrical intervention
- to connect the earth wire to an effective earthing system (**).

**DO NOT**
- to use cables with a cross-section of less than 1 mm²
- to use the water pipes to earth the appliance.

---

5.12.1 External sensor
The boiler is designed for connection to an external temperature sensor code 8094101, which will automatically regulate the central heating delivery temperature.

This means that the delivery temperature of the boiler can vary on the basis of the external temperature depending on the climatic curve selected from those shown in the diagram (Fig. 25).

**Climatic curve**

![Fig. 25](image)

**CAUTION**
If there is an external sensor, in order to select the optimal climatic curve for the system and therefore the delivery temperature based on the external temperature:
- select parameter "PAR 22" or "PAR 25" or "PAR 28" (see List of parameters) corresponding to zone 1, 2 or 3 as relevant
- press the ← or → button to select the curve suitable for reaching the desired room temperature.

The "20°" curve is factory set to reach a room temperature of 20°C.

The external sensor must be installed outside the building, on a flat surface, in a north or north-west position (coldest side) and well away from flue pipes, doors, windows and areas in direct sunlight.
When fitting the sensor on the outside of the building:
– remove the cover
– attach the sensor to the wall using 2 plugs
– make the electrical connections.

**NOTE:** Minimum cross-section of cables 1 mm²; maximum length of connection 50 m; unpolarised connection terminals.
5.13 Systems that can be controlled

Sime ALU PLUS HE boilers can control many types of systems. Here are some system diagrams, by way of example, in which the boiler can be a single appliance or a group of cascading boilers which can be considered as a single appliance in terms of heat output, where \( \text{Cascade output} = \text{Boiler output} \times \text{no. of boilers} \) installed.

5.13.1 Main hydraulic diagrams

Full hydraulic diagram

CAUTION
When systems using ALU PLUS HE single or cascade boilers are managed by MODBUS systems, Sime kits CANNOT be used to manage mixed circuits or the solar circuit. You MUST use external devices.
NOTE: For installations with a SINGLE BOILER, up to two MIX systems, or two groups of MIX systems, can be managed by installing the optional accessories MIX 1 ZONE KIT (code 8092275) and MIX 2 ZONE KIT (code 8092276). When systems using ALU PLUS HE single or cascade boilers are managed by MODBUS systems, Sime kits CANNOT be used to manage mixed circuits or the solar circuit. You MUST use external devices.

SP  Hydraulic separator  PMIX 1  MIX 1 system mixer valve
VZ1÷VZ2 Zone valves  PMIX 1  MIX 1 system pump
VuCD  MIX 1 system safety thermostat
SA  Auxiliary sensor (system delivery sensor, SMI

CAUTION
The system designer is responsible for choosing and sizing up the system components and MUST follow the best practice technical guidelines, as well as complying with the local and national legislation in force in the destination country.
5.14 Refilling or emptying

Before carrying out the operation described below, isolate the boiler power supply. Ensure that the inhibitor concentration is correct on refilling.

5.14.1 Method of filling a sealed system

A sealed system must only be filled by a competent person using a method similar to that shown in figure below.

![Diagram of a sealed system filling process](image)

5.14.2 SYSTEM Filling

**Sime ALU PLUS HE** boilers DO NOT have a device to fill the boiler/system and an emptying tap. Therefore these must be provided, during installation, assembled in the most convenient places for the installer.

Before carrying out the operations described below, make sure that the main system switch is set to "ON" in order for the display to show the pressure level in the system during refilling.

- there are no requests for heat
- the main system switch is set to "ON"
- the display shows the system pressure value
- the outlet valve is closed

- open the isolation and air bleeding valves in the highest points of the system
- open the heating circuit isolation valves
- activate the filling system "Method of filling a sealed system", and fill the heating system until a pressure of 0,8-6,0bar is shown on the display
- stop the filling system
- check that there is no air in the system by bleeding all the radiators and the circuit on the high points of the system
- check the pressure on the display and if necessary top up until the correct pressure reading appears
- it is recommended that the condensate trap is filled prior to fitting the flue, by carefully pouring water into the exhaust connection.

5.14.3 EMPTYING operations

- check that the water system isolation devices are closed
- connect a funnelling pipe to the system drain valve and open it.

When it has fully emptied, close the valve.
6.1 Preliminary operations

**WARNING**

Should it be necessary to access the areas in the bottom part of the appliance, make sure that the system components and pipes are not hot (risk of burning).

Before commissioning the appliance, check that:
- the type of gas is correct for the appliance
- the gas isolation valves for the heating system and the water system are open
- the pump impeller rotates freely
- the siphon has been filled.

6.2 Before commissioning

After having carried out the preliminary operations, proceed as follows:
- set the main system switch to “ON”
- The blue bar (4) on the control panel lights up. The symbols, “- -” message and the system pressure are shown correctly on the display
- check that the system pressure as shown on the display when the system is cold is as required, between 0.8 and 6.0 bar
- press button on the single boiler or the master boiler in the case of a cascade. The value of the delivery probe detected at that moment will appear on the display.

**PROCEDURE TO BE CARRIED OUT ONLY FOR CASCADE INSTALLATIONS**
- Disconnect the power supply by turning the main system switch to “OFF” and then on “ON”
- wait for approximately 3 seconds to allow the electronic board to run the necessary checks.

If there is a fault, the message “ALL”, the fault code, the message “RESET” (e.g. “ALL 06” - no flame detected) and the message will appear on the display.

**NOTE:** To restart the boiler press button , for about 3 seconds, and then release it. The boiler repeats the ignition cycle and works normally until the temperatures requested are reached.

6.3 Parameter setting and display

The parameters can be displayed and set with the boiler in stand-by ( ) or in operation.

To go into the parameter menu:
- press buttons and (for approximately 2 seconds) at the same time until “PAR --” (parameter number) and the value set “--” appears on the display
- to scroll through the parameters press buttons and
- to change the value set press buttons and .

To exit the menu and go back to the first screen, press one of the function buttons, excluding , or wait approx. 60 seconds without pressing any button.
6.4 List of parameters

The parameters PAR 01 and PAR 02 are factory set according to table “A” and automatically generate the settings for parameters PAR 04, PAR 08, PAR 18 and PAR 31 as shown in the table.

**DO NOT**

Use settings other than those shown in the table “A” as this could generate a serious boiler malfunction.

6.5 Configuring the auxiliary sensor

Below is the procedure for configuring the storage tank sensor (SB) or the auxiliary sensor (e.g., system delivery sensor, SMi).

- press buttons \( \text{CN1} \) and \( \text{CN2} \) (- 2s) at the same time until the parameter menu shows
- press buttons \( \text{CN1} \) and \( \text{CN2} \) (- 2s) at the same time again until “--” appears on the display
- to access the OEM parameters, enter the following key combination: \( \text{CN3} \), \( \text{CN4} \), \( \text{CN5} \), \( \text{CN6} \)
- press the \( \text{CN3} \) and \( \text{CN4} \) buttons to select the "OEM 52" parameter
- to change the "OEM 52" parameter settings and set the value to "5", press the \( \text{CN5} \) and \( \text{CN6} \) buttons
- to exit the menu and go back to the first screen, press one of the function buttons, excluding RESET, or wait approx. 60 seconds without pressing any buttons.

6.6 Fault/error message

In the event of a fault/malfunction the message “ALL” will appear on the display with the alarm number and the light bar (4) will turn red.

Example: “ALL 02” (Low System Pressure Error: less than 0.8 bar).

Before repairing the fault:
– disconnect the appliance from the mains power by setting the main switch to “OFF”
– as a precautionary measure, close the gas isolation valve.

Resolve the problem and start-up the boiler again.

NOTE: When, in addition to the message “ALL ...” the symbol also appears on the display, after having repaired the fault, button must be pressed for approx. 3 seconds, and then released. The boiler starts up again normally.

6.8 Gas calibration

After checking that the boiler is operating correctly, you must take combustion readings as well as maximum and minimum power readings, and check the combustion efficiency by activating the chimney sweeper function.

6.8.1 Chimney sweeper function and calibration

The chimney sweeper function is used by the qualified maintenance technician to check the gas pressure, detect the combustion parameters and measure the combustion efficiency when required by the legislation in force. This function lasts 15 minutes and is activated by proceeding as follows:

- with the boiler inactive, loosen the screw on the mains tapping point [1] on the gas valve and connect a pressure gauge to measure the CO₂ and check that it corresponds to the value in the table. If it does not correspond, adjust the “maximum power adjustment screw” [2] on the gas valve until you obtain the CO₂ value shown in the table. Take any other necessary readings.

Once any necessary adjustments and readings have been made:
- press the button to operate the boiler on minimum power [Qmin] as indicated on the display with
- measure the CO₂ and check that it corresponds to the value in the table. If it does not correspond, adjust the “minimum power adjustment screw” [3] on the gas valve until you obtain the CO₂ value shown in the table.

GAS VALVE

<td>9,5</td>
</tr>
<tr>
<td>720</td>
<td>9,5</td>
</tr>
<tr>
<td>1100</td>
<td>9,6</td>
</tr>
</tbody>
</table>

**CAUTION**

This procedure MUST BE PERFORMED after replacing the gas valve following a fault.
### 6.9 Operating data display

Once the boiler is operating, a qualified technician can view the operating data. To access the information, press the \( \mathcal{L} \) button. The first piece of information is shown on the display. Each time this button is pressed, the next piece of information is shown. If the \( \mathcal{L} \) button is not pressed, the system exits the function automatically. If there are expansion boards (Mix 1 or Mix 2 Zone or solar), the relative information cannot be shown.

MAINTENANCE

7.1 Servicing
For the appliance to operate safely, correctly and efficiently, current legislation requires that the system manager call upon the services of a professionally qualified technician to carry out regular maintenance, at least annually or according to the specific legal provisions.

CAUTION
- Only qualified persons in compliance with the instructions contained in this manual are permitted to install, commission and maintain this boiler. Suitable protective safety equipment MUST be worn. The installation of this boiler must be in accordance with the relevant requirements of the current Gas Safety (installation and use), the local building regulations, and I.E.E. wiring regulations.
- Make sure that the system components and pipes are not hot (risk of burning).

CAUTION
Before carrying out the interventions described below:
- set the main system switch to "OFF"
- isolate the gas cock
- avoid contact with any hot surfaces
- if components are replaced, use ONLY original spare parts.

7.2 External cleaning
7.2.1 Cleaning the case
When cleaning the cladding, use a cloth dampened with soap and water, or water and alcohol for stubborn marks, or with special products. Once cleaning is completed, dry the appliance.

DO NOT
Do not use abrasive products.

7.3 Burner Inspection
7.3.1 Cleaning the burner
To clean the burner:
- disconnect the connectors for the fan, gas valve, electrodes and flame detection sensor
- carefully remove the electrode unit and the flame detection sensor
- unscrew the joint between the pieces (1) of the gas line
- undo the four fixing screws (2) and remove the fan-gas valve unit (3) from the boiler body, taking care not to damage the gasket (4)
- carefully take out the burner (5) and clean it using compressed air or a soft brush to remove any obstructions

After cleaning has been completed, reassemble all the components previously removed, putting in new seals where necessary. In the event of possible detached electrical connections, refer to the diagrams in this manual.

CAUTION
A test must be carried out on the gas line seal, as required by legislation.
7.3.2 Cleaning boiler body
- Unscrew the nuts [6] and remove the inspection doors [7] and seals [8].
- Use a rod suitable for mechanically cleaning the boiler body ducts (e.g. Sime accessory [9] code 6077930). A chemical product can be used provided it is suitable for aluminium bodies working by condensation (e.g. Bekaert TAB 2/2000).

At the end of the cleaning operations, check the state of the seals [8] and if necessary replace them. Refit the [7] doors and retighten the nuts [6] using a 7 Nm tightening torque.

7.3.3 Dismantling and cleaning siphons and condensate collection tank
- Unscrew the nuts [10] and remove the inspection doors [11]. Check and clean the condensate collection tank. When cleaning has been completed, reassemble the door, checking the seal and replacing it if necessary.
- Retighten the nuts [10] using a 7 Nm tightening torque.
- Undo the ring nuts [12] and [13] and remove the siphon, watching out for any possible leaks of condensate.
- Undo the ring nut [14] and thoroughly clean the internal parts of the siphon.

7.3.4 Check of electrodes and flame detection sensor
It is recommended that the regulation of the ignition electrodes unit [17] and their wear, is always checked, along with that of the flame detection sensor [18]. If necessary replace them, taking care that gaskets [15] and [16] are not damaged during their extraction.

NOTE: When you insert the flame detection sensor, for example following maintenance, make sure that the sensor faston [18] is angled as shown in the figure.
7.3.5 Connecting the air pressure switch and siphon

The silicon tubes on the air pressure switches (1) and siphon (2) MUST be reconnected, where it was necessary to disconnect them, as shown in the figure:

- Outlet P1 on the air pressure switch (1) to the fan (3)
- Outlet P2 on the air pressure switch (1) and outlet P1 on the siphon pressure switch (2) to the boiler body (4).

NOTE: Outlet P2 on the siphon pressure switch (2) remains free.

7.4 Circuit Board Replacement

If you replace the electronic circuit board or gas valve YOU MUST SET THE PARAMETERS as described under "Parameter setting and display".

7.5 Possible faults and solutions

</table>
| 07               | Safety thermostat or siphon pressure switch triggered | The boiler stops due to activation of the safety thermostat or the siphon pressure switch. The system pump stays on for one minute | - Check whether there is little water in the system  
- Check the primary circulation pump  
- Check for possible obstruction of condensate drain  
- Check the electrical wiring and connections of the siphon pressure switch tubes  
- Once the fault is repaired, press the (reset) button to start the boiler again |
| 08               | Fault in flame detection circuit | Detection of a non-real flame signal, normally before ignition phase  
Faulty components | - Check the detection electrode and its connections  
- Check the electronic circuit board |
| 09               | No water circulating in primary system | Poor circulation of water in the primary water circuit is caused by the ΔT between the delivery sensor (SM) and return sensor (SR) and may occur on start-up or during operation | - Check system pressure and whether the water level in the system is low  
- Check the primary circulation pump  
- Check the delivery sensor (SM) and return sensor (SR) |
| 10               | Tank/anti-freeze sensor fault | The sensor connected to the AUX terminals is open or has short-circuited | - Check settings of parameter PAR 02  
- Check the sensor and its connections |
| 11               | Modulator disconnected error | The gas valve is disconnected from the electrics | - Check the electrical connection to the gas valve |
| 13               | Exhaust sensor (SF) intervention | The smoke detector (SF) has detected a too high temperature | - Check that the smoke duct, the flue pipe and the chimney have no obstructions  
- Once the fault is repaired, press the (reset) button to start the boiler again |
| 14               | Smoke probe fault | The smoke detector (SF) is open or has short-circuited | - Check the sensor and its connections |
| 15               | Fan fault | The fan speed is outside the pre-set range. If the anomaly activation condition continues for two minutes, the boiler carries out a forced stop for thirty minutes. At the end of the forced stop, the boiler will try to ignite again | - Check the fan rpm  
- Check the electronic circuit board |
| 18               | Boiler delivery probe temperature above 117°C | Other safety devices were not tripped earlier to limit the temperature of the boiler body | - Check that the delivery probe, safety thermostat and smoke probe are working correctly |
| 19               | External sensor fault (flashing warning) | The external sensor (SE) has short-circuited. The boiler continues normal operation | - Check the sensor and its connections |
| 20               | Mix 1 zone safety thermostat triggered | The Mix 1 system’s delivery probe is faulty  
The mixer valve has failed  
The board has failed | - Check the delivery probe  
- Check the mixer valve  
- Check operation of the board  
- Check the electrical connections of all components |
| 21               | Mix 1 Zone valve delivery probe fault | The Mix system’s delivery probe is open or has short-circuited | - Check the sensor and its board connections  
- Check operation of the board |
| 22               | Mix 2 zone safety thermostat triggered | The Mix 2 system’s delivery probe is faulty  
The mixer valve has failed  
The board has failed | - Check the delivery probe  
- Check the mixer valve  
- Check operation of the board  
- Check the electrical connections of all components |
| 23               | Mix 2 Zone valve delivery probe fault | The Mix system’s delivery probe is open or has short-circuited | - Check the sensor and its board connections  
- Check operation of the board |
| 24               | S1 solar delivery probe fault | The solar system’s delivery probe is open or has short-circuited | - Check the sensor and its board connections  
- Check operation of the board |

8 CASCADING SYSTEMS

8.1 Cascade characteristics

Each boiler connected in a cascade must be identified with a specific address than can be set under the relevant parameter (PAR 15), which determines how it behaves.

WARNINGS
For the cascade to function correctly, the external sensor (SE) must be installed.

8.2 Characteristics of cascading boilers

Master boiler
The master boiler is the only boiler to which the TAs and the room control units must be connected, as well as all of the system components such as pumps, zone valves and external sensors. It is the only one that communicates with the other slave boilers in the cascade.

The heat requests are then sent to the master boiler and managed according to an algorithm that controls the cascade by turning the slave boilers on and off, and activating the pumps and necessary valves, etc.

As well as controlling the specific boiler parameters, it also controls the main cascade parameters.

Slave boiler no. 1
Slave boiler no. 1 acts as the main slave boiler in the cascade. The cascade delivery probe (SMC) MUST be connected to connector CN4 on the electronic board. The temperature value detected by the SMC probe is read cyclically and used by the algorithm to manage the cascade in heating mode.

Slave boiler no.s ... (from no. 2 to no. 7)
All slave boilers contribute to producing the heat needed to serve the connected systems, and each slave boiler receives an on/off command from the master boiler only.

The function [user] buttons on all of the slave boilers are disabled, with the exception of the RESET button which is used ONLY in cases where the boiler locks out. The installer buttons remain enabled to ensure that the appliance is configured correctly.

Producing domestic hot water
Domestic hot water is produced when a storage tank is installed in the system which can be managed as a “direct system” or assigned to any boiler in the cascade, whether master or slave. The necessary parameters must clearly be set for managing the probe, tank pump, anti-legionella and any priority or simultaneous operation (PAR 2).

WARNINGS
When boilers are connected in a cascade, they communicate ONLY with the master boiler, treating the cascade as a single heat generator where:

Cascade output = Boiler output x no. of boilers installed

8.3 Approximate clearance measurements

CAUTION
Observe the required clearances.
8.4 Main primary circuit

Sime ALU PLUS HE boilers can be connected in a cascade without additional components as they are equipped with the specific cascade board as standard. The cascade can be made up of between two and eight boilers of the same model (e.g. three ALU PLUS HE 360).

DO NOT

The cascade CANNOT be composed of different boiler models (e.g. two ALU PLUS HE 360 and one ALU PLUS HE 720).

---

**KEY:**

- TA Room thermostat for boiler activation
- M Boiler delivery
- R Boiler return
- GS INAIL safety unit (Italy only)
- Vsic Relief valve
- SP Hydraulic separator
- MCP Primary circuit pump
- NC Condensate neutraliser
- SE External sensor (Obligatory)
- SMC Cascade delivery probe

---

**CAUTION**

The system designer is responsible for choosing and sizing up the system components and MUST follow the best practice technical guidelines, as well as complying with the local and national legislation in force in the destination country.

(*) NOx class according to UNI EN 15502-1:2015
(**) Heat input calculated using the lower heat output (Hi)
(***) Multiply the value by the number of boilers that make up the cascade installation G20 Hi. 9,45 kW/m³ (15°C, 1013 mbar)
8.6 Smoke outlet and combustion air inlet

The smoke outlet MUST be sized by an expert and installed by an installer who MUST use approved materials, suited to the type of appliances, and follow the best practice technical guidelines and comply with the national and local legislation in force.

**CAUTION**
- Smoke outlets that are inadequate or the wrong size can have a negative impact on the combustion parameters and amplify the combustion noise.
- The smoke outlet on each boiler in the cascade should be connected to an exhaust flue. When necessary, use motorised valves (SCR), [see “Optional accessories”].

---

**Smoke outlet connections**

8.7 Gas line

The gas supply line manifold (CG) must be sized by an expert, and implemented during installation according to the line pressure and the heat input of the appliances that make up the cascade.

8.8 Evacuating condensate

To evacuate the condensate, create a manifold with all of the ducts, appliances and smoke outlet and put a neutralising device in place, such as one of the models that can be supplied separately on request.
8.9 Electrical connections for the cascade

The electrical connections between the Sime ALU PLUS HE boilers which make up the cascade are shown in the following diagram, and the wiring diagrams for the individual appliances are shown on the next few pages.

**WARNINGS**

*Sime* declines all responsibility for any injury or damage to persons, animals, or property as a result of failure to provide adequate earthing of the appliance.

- The external temperature sensor "SE" is OBLIGATORY and MUST be connected to the master boiler.
- The cascade delivery probe "SMC" MUST be connected to slave boiler no. 1.

8.13 Displaying and setting cascade parameters

The parameters for Sime ALU PLUS HE boilers in a cascade can be displayed and set in the same way as with single boilers (see "Parameter setting and display" and "List of parameters").

**WARNINGS**

For the cascade to function correctly, the external sensor (SE) must be installed.

8.13.1 Routing the cascading boilers

**CAUTION**

Before changing "PAR 15" (routing the cascade), the boilers in the cascade must be set to WINTER mode.

On each boiler in the cascade, "PAR 15" must be set as follows:
- "0" to identify the master boiler
- "1" to identify slave boiler no. 1
- "2" to identify slave boiler no. 2
- "3" to identify slave boiler no. 3
- "4" to identify slave boiler no. 4
- "5" to identify slave boiler no. 5
- "6" to identify slave boiler no. 6
- "7" to identify slave boiler no. 7

**NOTE:** Avoid labelling the slave boilers with the same number.

8.13.2 CASCADE parameters for the master boiler

After setting PAR 15 on the master boiler, and where there are more than two boilers in the cascade, access the CASCADE parameters on the master boiler (identified by PAR A plus a number as shown in the table) and configure parameter PAR A1.

To access the CASCADE parameters:
- press buttons $L$ and $M$ (~ 2s) at the same time until the parameter menu shows
- press buttons $L$ and $M$ (~ 2s) at the same time again until "--" appears on the display
- to access the CASCADE parameters, enter the following combinations of keys: $U$, $D$, $L$, $M$
- to scroll through the parameters press buttons $L$ and $M$
- to change the parameter settings, press buttons $U$ and $D$
- to exit the menu and go back to the first screen, press one of the function buttons, excluding RESET, or wait approx. 60 seconds without pressing any buttons.

8.14 Fault / malfunction codes

Every boiler in the cascade manages its own faults as described in "Fault / malfunction codes".

The faults that generate a lockout in a specific boiler are reset by pressing the RESET button on the relevant boiler.

A lockout in the master boiler is reset either by pressing the RESET button or from a remote device.

For the master and slave no. 1 boilers, specific faults can be checked for as shown in the table:

<table>

Benchmark Commissioning & Warranty Validation Service Record

It is a requirement that the boiler is installed and commissioned to the manufacturers’ instructions and the data fields on the commissioning checklist completed in full.

To instigate the boiler warranty the boiler needs to be registered with the manufacturer within one month of the installation. The warranty rests with the end-user (consumer), and they should be made aware it is ultimately their responsibility to register with the manufacturer, within the allotted time period.

It is essential that the boiler is serviced in line with the manufacturers’ recommendations, at least annually. This must be carried out by a competent Gas Safe registered engineer. The service details should be recorded on the Benchmark Service and Interim Boiler Work Record and left with the householder. Failure to comply with the manufacturers’ servicing instructions and requirements will invalidate the warranty.

www.hhic.co.uk

This Commissioning Checklist is to be completed in full by the competent person who commissioned the boiler as a means of demonstrating compliance with the appropriate Building Regulations and then handed to the customer to keep for future reference.

Failure to install and commission according to the manufacturers’ instructions and complete this Benchmark Commissioning Checklist will invalidate the warranty. This does not affect the customer’s statutory rights.

* All installations in England and Wales must be notified to Local Authority Building Control (LABC) either directly or through a Competent Persons Scheme. A Building Regulations Compliance Certificate will then be issued to the customer.

* A System inhibitor efficacy test is required on every annual service in accordance with the manufacturers’ instructions and BS 7593. It is only acceptable to not have undertaken this if the service engineers attendance visit was in between annual services to attend a non-water facing component.

SERVICE & INTERIM BOILER WORK RECORD

It is recommended that your boiler and heating system are regularly serviced and maintained, in line with manufacturers’ instructions, and that the appropriate service / interim work record is completed.

Service provider

When completing a service record (as below), please ensure you have carried out the service as described in the manufacturers’ instructions. Always use the manufacturers specified spare parts.

**SERVICE/INTERIM WORK ON BOILER**

</table>
Manufacturers Instructions

Manufacturer’s instructions must be followed for the correct connection of the condensate discharge pipe from the boiler as this may vary due to the design of the boiler. For example a visible air break and trap is not required if there is a trap with a minimum condensate seal of 75 mm incorporated into the boiler.

Internal Pipe Run In Unheated Spaces
Condensate discharge pipes that are routed in an unheated space such as a loft or garage should be insulated to prevent freezing.

Internal Condensate Pipe Discharge Termination

Internal condensate discharge pipework must be a minimum of 19mm ID (typically 22mm OD) plastic pipe or as per manufacturer’s instructions and this should “fall” a minimum of 45mm per metre away from the boiler, taking the shortest practicable route to the termination point. (45mm as per BS6798, 52mm per metre as per industry practice is specified in the following diagrams)

To minimise the risk of freezing during prolonged sub-zero conditions, an internal “gravity discharge point” such as an internal soil stack (preferred method), internal kitchen, utility room or bathroom waste pipe e.g. from a sink, basin, bath or shower should be adopted, where possible.

Note - A suitable permanent connection to the foul waste pipe should be used. Figures 1, 2(a), 2(b) show appropriate connection methods.
Figure 1 – Connection of condensate discharge pipe to internal soil and vent stack. Note – Check manufacturer’s instructions to see if an air break is required.

Key

1 Boiler
2 Visible air break
3 75 mm trap
4 Visible air break and trap not required if there is a trap with a minimum condensate seal of 75 mm incorporated into the boiler
5 Soil and vent stack
6 Invert
7 450 mm minimum up to three storeys
8 Minimum internal diameter 19 mm
Internal Condensate Pipe Discharge Termination

Figure 2(a) – Connection of a condensate discharge pipe downstream of a sink, basin, bath or shower waste trap.
Note – Check manufacturer’s instructions to see if an air break is required.

Key
1 Boiler
2 Visible air break
3 75 mm trap
4 Visible air break and trap not required if there is a trap with a minimum condensate seal of 75 mm incorporated into the boiler. In this case the 100 mm is measured to the trap in the boiler.
5 Sink, basin, bath or shower
6 Open end of condensate discharge pipe direct into gully 25 mm min below grating but above water level; end cut at 45°
   Note – the maximum external condensate discharge length is 3 metres
7 Sink lip
8 Minimum internal diameter 19 mm
9 Pipe size transition
10 Minimum internal diameter 30 mm
11 Water/weather proof insulation
12 Drain cover/leaf guard
Internal Condensate Pipe Discharge Termination

Figure 2(b) – Connection of a condensate discharge pipe upstream of a sink, basin, bath or shower waste trap

Key
1 Boiler
2 Visible air break at plug hole – alternative connection can be below sink trap
3 75 mm sink, basin, bath or shower waste trap
4 Sink, basin, bath or shower with integral overflow
5 Open end of condensate discharge pipe direct into gully 25 mm min below grating but above water level; end cut at 45 °
Note – the maximum external condensate discharge length is 3 metres
6 Minimum internal diameter 19 mm
7 Pipe size transition
8 Minimum internal diameter 30 mm
9 Water/weather proof insulation
10 Fit drain cover/leaf guard
Internal Condensate Pipe Discharge Termination

The possibility of waste pipes freezing downstream of the connection point should be considered when determining a suitable connection point - e.g. a slightly longer pipe run to an internal soil stack may be preferable to a shorter run connecting into a kitchen waste pipe discharging directly through the wall to an external drain.

Note - Where “gravity discharge” to an internal termination is not physically possible (e.g. the discharge point is above the appliance location, or access is obstructed by a doorway), or where very long internal pipe runs would be required to reach a suitable discharge point, then a condensate pump should be used.

External waste pipes from kitchens, utility rooms or bathrooms such as sink, basin, and bath or shower waste outlets should be insulated with waterproof UV resistant, class 0 material, terminated below the grid but above the water line and a drain/leaf guard fitted. The waste pipe should be cut at 45 degrees where it terminates into the grid. (See insulation section for guidance on suitable materials).

Condensate Pumps

Use of a Condensate Pump to an Internal Termination

Condensate can be removed using a proprietary condensate pump, of a specification recommended by the boiler or pump manufacturer. In order to minimise the risk of freezing during prolonged sub-zero spells, one of the following methods internal to the property for terminating the boiler condensate pump to a foul water discharge point should be adopted such as an internal soil stack (preferred method), internal kitchen, utility room or bathroom waste pipe such as sink, basin, and bath or shower waste. Figure 3 shows a typical connection method.
Internal Condensate Pipe Discharge Termination

Figure 3 – Connection of a condensate pump - typical method (NB manufacturer’s detailed instructions should be followed). Note – Any external pipe work should be insulated, pipe cut at 45 degrees and a drain/leaf guard fitted.

Key
1 Condensate discharge from boiler
2 Condensate pump
3 Visible air break at plug hole
4 Sink or basin with integrated overflow
5 75mm sink waste trap

Key
1 Boiler
2 Visible air break at plug hole
3 75 mm sink, basin, bath or shower waste trap
4 Sink, basin, bath or shower with integral overflow
5 Open end of condensate discharge pipe direct into gully 25 mm min below grating but above water level; end cut at 45 ° Note – the maximum external condensate discharge length is 3 metres
6 Minimum internal diameter 19 mm
7 Pipe size transition
8 Minimum internal diameter 30 mm
9 Water/weather proof insulation
10 Fit drain cover/leaf guard
External Connections

Only fit an external boiler condensate drain connection if an internal gravity or pumped connection is impractical to install.

The pipe work from the boiler should be of a minimum 19mm ID or as per manufacturer’s instructions and the condensate discharge pipe shall be run in a standard drainpipe material, e.g. poly (vinyl chloride) (PVC), un-plasticized poly (vinyl chloride) (PVC-U), acrylonitrile butadiene-styrene (ABS), polypropylene (PP) or chlorinated poly (vinyl chloride) (PVC-C).

Note - Fixing centres for brackets should be a maximum of 300mm for flexible pipe and 500mm for solid pipe and manufacturer’s recommendations should be followed.

The condensate pipe should be run internally as far as possible before going externally and the pipe diameter should be increased to a minimum of 30mm ID (typically 32mm OD) before it passes through the wall. The angle of the pipe should slope downwards by at least 3 degrees as it passes through the wall to assist in maintaining a good velocity as the condensate exits the building.

The external pipe run should be kept as short as possible to a maximum of 3 metres, taking the most direct and “most vertical” route to the discharge point, with no horizontal sections in which condensate might collect.
External Connections

October 2018 Issue 1.0
External Connections

Alternative Solutions
Cold weather protection methods approved or endorsed by boiler manufacturers and/or service organisations may be adopted if these are considered suitable by the parties involved. It is the responsibility of the manufacturer of these products to ensure they have completed the necessary testing or calculations to ensure the product offers suitable protection to prevent the condensate pipe from freezing. The product manufacturer should provide information as to what level of external temperature and for what time period the product can protect against sub-zero temperatures, i.e. -15°C for 48 hours. BS6798 refers to devices that pump the condensate produced by a condensing boiler to a fine misting nozzle in the boiler flue terminal so that the condensate is discharged with the hot flue gas. (BS6798 section 6.3.8 note 4). The boiler manufacturer’s instructions will provide advice regarding fitting and siting of the flue terminal to ensure safe disposal of the condensate.

Additional Measures

At least one of the following measures should be fitted in addition to the measures detailed above for external condensate discharge pipes

- Insulate external pipe with a minimum thickness of insulation to be 19mm “O” class PVC coated material.
- Fit trace heating – with insulation as recommended by manufacturer.
- Fit internal auxiliary(additional) high volume syphon unit

Auxiliary Syphon – Fitted Internally
Auxiliary siphons fitted inside the premises assist with the siting of the boiler where an external condensate pipe must be fitted. The storage capacity of the auxiliary siphon increases the volume of condensate discharge reducing the risk of freezing. A further reduction in the potential for the pipe to freeze is achieved when combined with the external insulation requirements.
External Connections

Electric Trace Heating
Trace heating with an external thermostat can be fitted to the external condensate pipe to raise the temperature of the condensate pipe in freezing conditions. Trace heating takes the form of an electrical heating element run in physical contact along the length of the condensate pipe. The pipe is usually covered with thermal insulation to retain heat losses from the pipe. Heat generated by the element then maintains the temperature of the pipe. If such a system is used then the installation instructions of the trace heating manufacturer and any specific recommendations regarding pipe diameter, insulation, etc. should be followed. All other relevant guidance on condensate discharge pipe installation should also be followed.

Insulation Materials
Insulation used for external condensate pipes, sink or washing machine waste pipes should be of class ‘O’ grade with an outer coating that is weather proof, bird/animal proof, and UV resistant finish. A minimum of 19mm thick insulation is recommended for 32mm external pipes.

Use of Air Breaks In Condensate Discharge Pipes
Heating engineers should follow manufacturer’s instructions on the use of air breaks in condensate discharge pipes. A visible air break is not required if the boiler condensate trap has a minimum condensate seal of 75mm incorporated into the boiler.

Connecting to a rain water downpipe/External Soil Stack
When an external soil stack or rain water downpipe is used as the termination (NB only permissible if this downpipe passes to a combined foul and rainwater drainage system) an external air break must be installed between the condensate discharge pipe and the downpipe to avoid reverse flow of rainwater/sewage into the boiler should the downpipe itself become flooded or frozen.

Figure 5 shows a suitable connection method. Pipe insulation should be fitted.
External Connections

Figure 5 – External termination to rainwater downpipe (NB only combined foul/rainwater drain)

Key
1 Condensate discharge pipe from boiler
2 Pipe size transition point
3 Water/weather proof insulation
4 43mm 90° male/female bend
5 External rain water pipe into foul water
6 External air break
7 Air gap
8 68mm PVCu strap on fitting
9 Minimum internal diameter 19mm
10 Minimum internal diameter 30mm
11 End cut at 45°
External Connections

External Termination of the Condensate Pipe
Where the condensate discharge pipe is terminated over an open foul drain or gully, the pipe should terminate below the grating level, but above water level, in order to minimise “wind chill” at the open end. Pipe drainage and resistance to freezing will be improved if the termination end of the condensate pipe is cut at 45 degrees as opposed to a straight cut.

The use of a drain cover (such as those used to prevent blockage by leaves) must be fitted to offer further protection from wind chill. Figure 6 (following page) shows a suitable connection method. Where the condensate drain pipe terminates in a purpose-designed soakaway (see BS 6798:2014 or boiler installation manual for soakaway design requirements) any above-ground section of condensate discharge pipe should be run and insulated as described above. Figure 7 (following page) shows a suitable connection method.

Unheated Areas in Buildings
Internal condensate drainage pipes run in unheated areas such as lofts, basements and garages should be treated as external connections and insulated accordingly. Weather proof materials may not be necessary and should be assessed by the heating engineer.

Use of Air Breaks In Condensate Discharge Pipes
Installers should follow the manufacturer’s instructions on the use of air breaks in condensate discharge pipes. A visible air break and trap is not required if the boiler condensate trap has a minimum condensate seal of 75 mm incorporated into the boiler.
Figure 6 – External drain, gully or rainwater hopper

Key
1 Boiler
2 Visible air break
3 38mm minimum trap
4 Visible air break and trap not required if there is a trap with a minimum condensate seal of 38 mm incorporated into the boiler – refer to manufacturers instructions
5 External length of pipe 3 m maximum

7 Minimum internal diameter 19 mm
8 Pipe size transition point
9 Minimum internal diameter 30 mm
10 Water/weather proof insulation
11 Fit drain cover/leaf guard

October 2018 Issue 1.0
External Connections

Figure 7 – Example of a purpose made soakaway

Key
1 Condensate discharge pipe from boiler
2 Ground (this section of the condensate discharge pipe may be run either above or below round level); End cut at 45°
3 Diameter 100 mm minimum plastic tube
4 Bottom of tube sealed
5 Limestone chippings
6 Two rows of three 12 mm holes at 25 mm centres, 50 mm from bottom of tube and facing away from house
7 Hole depth 400 mm minimum by 300 mm diameter
8 Minimum internal diameter 19 mm
9 Pipe size transition point
10 Minimum internal diameter 30 mm
11 Water/weather proof insulation
Prior to CO and Combustion Ratio Check

**Prior to CO and Combustion Ratio Check**

The installation instructions should have been followed, gas type verified and gas supply pressure/rate checked as required prior to commissioning.

As part of the installation process, especially where a flue has been fitted by persons other than the boiler installer, visually check the integrity of the whole flue system to confirm that all components are correctly assembled, fixed and supported. Check that manufacturer’s maximum flue lengths have not been exceeded and all guidance has been followed (e.g. Gas Safe Technical Bulletin TDB08).

The flue gas analyser should be of the correct type, as specified by BS 7967.

Prior to its use, the flue gas analyser should have been maintained and calibrated as specified by the manufacturer. The installer must have the relevant competence for use of the analyser.

Check and zero the analyser in fresh air as per analyser manufacturer’s instructions.

---

**Flowchart for CO and Combustion Ratio Check on Commissioning a Condensing Boiler**

**Prior to CO and Combustion Ratio Check**

1. The installation instructions should have been followed, gas type verified and gas supply pressure/rate checked as required prior to commissioning.
2. As part of the installation process, especially where a flue has been fitted by persons other than the boiler installer, visually check the integrity of the whole flue system to confirm that all components are correctly assembled, fixed and supported. Check that manufacturer’s maximum flue lengths have not been exceeded and all guidance has been followed (e.g. Gas Safe Technical Bulletin TDB08).
3. The flue gas analyser should be of the correct type, as specified by BS 7967.
4. Prior to its use, the flue gas analyser should have been maintained and calibrated as specified by the manufacturer. The installer must have the relevant competence for use of the analyser.
5. Check and zero the analyser in fresh air as per analyser manufacturer’s instructions.

**Set Boiler to Maximum Rate**

- Set the boiler to operate at maximum rate (full load condition). Allow sufficient time for combustion to stabilise.
- **NOTE**: Do not insert analyser probe during this period to avoid possible “flooding” of sensor.

**Carry out Flue Integrity Check Using Analyser**

- Insert analyser probe into the air inlet test point and allow readings to stabilise.
- **NOTE**: The flue must always be installed with flue test point. This will be located within the first piece connected to the boiler.

**Check O₂ and CO at Maximum Rate**

1. **Is O₂ less than or equal to 20.6% and CO2 less than 0.2%?**
   - **YES**: Verify flue integrity.
   - **NO**: Check all seals around the appliance burner, internal flue seals, door and case seals. Rectify where necessary.

**Check CO and Combustion Ratio at Maximum Rate**

1. **Is CO less than 350ppm and CO/CO₂ ratio less than 0.004?**
   - **YES**: Set boiler to minimum rate.
   - **NO**: Turn off appliance and call SIME LTD Technical Helpline for advice.

**Set Boiler to Minimum Rate**

- In accordance with boiler instructions, set boiler to operate at minimum rate (to minimum load condition). Allow sufficient time for combustion to stabilise.
- **NOTE**: If manufacturer’s instructions do not specify how to set boiler to minimum rate contact Technical Helpline for advice.

**Check CO and Combustion Ratio at Minimum Rate**

1. **Is CO less than 350ppm and CO/CO₂ ratio less than 0.004?**
   - **YES**: Boiler is operating satisfactorily, no further actions required.
   - **NO**: Turn off appliance and call SIME LTD Technical Helpline for advice.

**Check and Record CO and Combustion Ratio at Both Maximum and Minimum Rate Before Contacting SIME LTD.**

**Complete Benchmark Checklist, Recording CO and Combustion Ratio Readings as Required.**
